

PROJECT TITLE: OptiCrop: Smart Agricultural Production Optimization Engine

CUSTOMER JOURNEY MAP STAGES:

1. User Phase Target Discovery: Farmer looks up web tool address location online to determine sustainable farming choices.
2. Input Actions Framework: Key numbers from field measurements are dropped directly inside the intuitive Bootstrap data input fields row.
3. System Processing Interval: Flask calls the .pkl calculation classifier script file without any long processing loading bars showing up.
4. Final Experience Output: Instant production optimization recommendation yields perfect clear answers for the farmer to plan upcoming seasonal crops.
